

WEBSITE PERFORMANCE AUDIT

Prepared by SiteCheck Pro | Confidential Website Audit

YOUR ACTION PLAN

Start Here

We checked <https://samplebusiness.com/> across six areas — speed, SEO, conversion, accessibility, technical health, and trust. Here's the honest picture: **3 urgent** issues need attention, **6** are worth fixing when you can, and **4** things you are already doing well. Don't try to tackle everything at once — start with the three below.

3

URGENT

Fix these now

6

WORTH FIXING

When you can

4

DOING WELL

Already strong

IF YOU DO NOTHING ELSE, FIX THESE THREE FIRST

1

Improve mobile load speed

Mobile speed is the highest-impact issue in this sample. The fix usually involves image cleanup, caching, and script review, followed by re-testing.

2

Add missing search snippets and local SEO basics

Meta descriptions, stronger titles, and local schema help Google and customers understand the business faster.

3

Fix hidden technical errors

JavaScript errors should be reviewed so forms, galleries, booking tools, and tracking keep working correctly.

Want this handled for you?

Most of our clients would rather not spend a weekend in WordPress. We can handle the critical items identified in this report — backed up, tested, and confirmed within 48 hours. Just reply to the email this report came with, or visit websitecheckpro.com to get started. For this report, that means: mobile image/load speed, meta description, and JavaScript console errors.

Quick Wins Package — \$297 | Critical fixes handled | 48-hour turnaround

MOBILE	48 Performance POOR	89 Accessibility NEEDS WORK	96 Best Practices GOOD	85 SEO NEEDS WORK

KEY INSIGHT: Mobile Speed Is Holding the Site Back

Google's mobile test shows the page loading slower than recommended. For a local business, that creates friction before visitors can see the offer, trust signals, or contact options.

PERFORMANCE & SPEED

CRITICAL

Mobile load speed is slower than recommended

The mobile performance score is below Google's recommended range. This can affect rankings and make visitors wait before they can interact with the site.

RECOMMENDED FIX

1. Review the largest homepage images, caching setup, and scripts that load before the first screen.
2. After changes, re-test the page to confirm the mobile score and LCP improved.

Included in Quick Wins: setup, testing, and confirmation handled for you.

WARNING

Unused JavaScript is adding extra weight

The page loads scripts that are not needed for the first view. This can slow down mobile visitors and delay taps on buttons or forms.

RECOMMENDED FIX

1. Audit active plugins and third-party scripts, then remove or defer what is not needed on the homepage.
2. Test contact forms, galleries, and tracking after cleanup.

GOOD

Server response is healthy

The server responds quickly, which means hosting is not the main bottleneck.

NOTE

No action needed. Focus speed work on page assets rather than changing hosts.

SEO & DISCOVERABILITY

CRITICAL

Homepage meta description is missing

Without a meta description, Google may choose random page text for the search snippet. A clear snippet can improve click-through from search results.

RECOMMENDED FIX

1. Add a concise homepage meta description focused on the business, service, and location.
2. Repeat this for the highest-value pages.

Included in Quick Wins: setup, testing, and confirmation handled for you.

WARNING

Page title could target local searches better

The homepage title should clearly describe what the business does and where it serves customers.

RECOMMENDED FIX

Update the SEO title to include the business name, main service, and city or service area.

WARNING

LocalBusiness schema is missing

Structured data helps Google understand the business name, location, contact details, and service type.

RECOMMENDED FIX

Add valid LocalBusiness schema and test it with a structured-data validator.

Included in Quick Wins: setup, testing, and confirmation handled for you.

CONVERSION & USER EXPERIENCE

WARNING

Primary call-to-action needs to be easier to find

Visitors should quickly understand the next step, whether that is calling, booking, requesting a quote, or scheduling a visit.

RECOMMENDED FIX

1. Make the main action button visible early on desktop and mobile.
2. Send visitors directly to the contact, quote, or booking flow.

WARNING

Pricing or package signal is unclear

Many local-service visitors want a basic price range or expectation before they contact a business.

RECOMMENDED FIX

Add a simple pricing anchor, package teaser, or expectation-setting line near the main CTA.

GOOD

Contact options are present

The site includes visible ways for visitors to get in touch.

NOTE

No urgent action needed. Keep contact options easy to access on mobile.

ACCESSIBILITY

WARNING

Important images need better alt text

Alt text helps screen readers and gives search engines more context about key images.

RECOMMENDED FIX

Prioritize natural descriptions for hero images, gallery highlights, and images near calls-to-action.

GOOD

Mobile viewport is configured correctly

The page is set up to render correctly on mobile screens.

NOTE

No action needed. Preserve this during future redesigns.

TECHNICAL HEALTH

CRITICAL

JavaScript console errors are present

Console errors can indicate broken scripts, forms, galleries, or tracking. Some issues are invisible to visitors but still affect performance or conversions.

RECOMMENDED FIX

1. Review browser console errors and identify whether any affect key site functions.
2. Fix or remove the broken scripts, then re-test the site.

Included in Quick Wins: setup, testing, and confirmation handled for you.

GOOD

HTTPS is active

The site loads over a secure connection, which is required for trust and modern browser compatibility.

NOTE

No action needed. Keep SSL auto-renew enabled.

TOP 3 PRIORITIES — DO THESE FIRST

1

Improve mobile load speed

Mobile speed is the highest-impact issue in this sample. The fix usually involves image cleanup, caching, and script review, followed by re-testing.

2

Add missing search snippets and local SEO basics

Meta descriptions, stronger titles, and local schema help Google and customers understand the business faster.

3

Fix hidden technical errors

JavaScript errors should be reviewed so forms, galleries, booking tools, and tracking keep working correctly.

WANT US TO HANDLE IT?

The Quick Wins Package focuses on the critical fixes identified in this report. We log in, make the changes, test the site, and confirm the work with you within 48 hours.

For this report, that means: mobile image/load speed, meta description, and JavaScript console errors.
